Part I Transportation Systems

1	Introduction	3
2	Passenger Transportation Systems	7
2.1	Elevators	9
2.1.1	Construction and Operation	10
2.1.2	Safety	10
2.1.3	Modern Technology	10
2.1.4	Control	10
2.2	Other Passenger Transportation Equipment	11
2.2.1	Escalators	11
2.2.2	Moving Walkways	13
2.2.3	Horizontal Elevators	13
3	Cargo Transportation Systems	15
3.1	Freight Elevators	15
3.2	Conveyors	15
3.3	Automated Guided Vehicles	17
3.4	Stacker Cranes	18
4	External Connections and Related Systems	19
4.1	External Connections	19
4.1.1	Pedestrian Connections	19
4.1.2	Freight Connections	19
4.2	Related Systems	19
4.2.1	Factory Automation	20
4.2.2	Warehouse Automation	20
4.2.3	Hospital Automation	20

Part II Modeling and Simulation

5	General Modeling Concepts	23
5.1	Components and Topology	23
5.1.1	Vehicles	23
5.1.2	Guideways	24
5.1.3	Signal Systems	26
5.1.4	Zones and Banks	28
5.1.5	Nodes and Links	29
5.2	Human-machine Interaction and Control Objectives	30
5.2.1	Modeling of the Traffic	30
5.2.2	Human-machine Interface of Elevators	31
5.2.3	Human-machine Interface of Escalators and Other Equipment	32
5.2.4	Control Objectives	32
6	Queuing Models	33
6.1	General Overview of Queuing Models	33
6.2	Queuing Models for Elevator Systems	34
6.2.1	The Simplest Case: M/M/1 Model	34
6.2.2	A More General Model: M/G/1	36
7	Modeling Techniques for Discrete Event Systems	39
7.1	Field Studies	39
7.2	Monte-Carlo Modeling	41
7.2.1	Simulation Techniques	41
7.2.2	Modeling by ESM-based Methodology	41
7.3	The ESM Framework for Simulations	43
7.3.1	The ESM Model for Discrete Event Simulation	43
7.3.2	Communication Between ESMs	45
7.3.3	Tools for Defining the ESM Model	47
7.3.4	Implementation of the Simulation Program	48
7.4	Modeling Cooperating Elevators and AGVs by the ESM Methodology	50
7.4.1	Traffic Survey as the Starting Point for Simulations	51
7.4.2	A Simplified Model of the Traffic in the Building	52
8	Scheduling Models with Transportation	55
8.1	Jobshop Scheduling Problems	55
8.2	Classification of Jobshop Scheduling Problems	61
8.3	Computational Complexity and Optimization Methods for JSP	62
8.4	Robotic Cell Scheduling Problems	64

Part III Intelligent Control Methods for Transportation Systems

9	Analytical and Heuristic Control of Transportation Systems	69
9.1	Evolution of Control Methods	69
9.2	Analytical Approaches	70
9.3	Heuristic Rules	71
9.3.1	Algorithmic Control	72
9.3.2	Fuzzy AI Group Control	73
9.4	Early Approaches to Optimal Control	74
10	Adaptive Control by Neural Networks and Reinforcement Learning	79
10.1	Information Processing by Neural Networks	79
10.2	Multilayer Perceptrons	80
10.2.1	Model of the Processing Units	80
10.2.2	Structure and Operation of the Multilayer Perceptron	80
10.2.3	Expressive Power of the MLP	82
10.3	Learning as an Optimization Problem	83
10.3.1	Nonlinear Optimization by the Gradient Method	84
10.3.2	Derivation of the Learning Rule	85
10.3.3	Hints for the Implementation and Use of the BP Method	87
10.3.4	Using More Refined Optimization Methods	89
10.4	Learning and Generalization by MLPs	91
10.4.1	Learning and Generalization	91
10.4.2	Generalization in the Case of MLPs	91
10.4.3	Testing MLPs	91
10.4.4	Learning by Direct Optimization	92
10.4.5	Forward-Backward Modeling	92
10.4.6	Learning with Powell's Conjugate Direction Method	93
10.4.7	Learning by Genetic Algorithms	93
10.5	Reinforcement Learning	94
10.5.1	Markov Decision Processes	94
10.5.2	Dynamic Programming (DP)	96
10.5.3	The Value Iteration Method	97
10.5.4	Q -learning	98
11	Genetic Algorithms for Control-system Optimization	103
11.1	Stochastic Approach to Optimization	103
11.2	Genetic Algorithm	104
11.2.1	Combinatorial Optimization with GA	105
11.2.2	Nonlinear Optimization with GA	107
11.2.3	GA as the Evolution of Distributions	108
11.2.4	GA and Estimation of Distributions Algorithms	110

11.3 Optimization of Uncertain Fitness Functions by Genetic Algorithms	111
11.3.1 Introduction to GA for Optimization with Uncertainty .	111
11.3.2 Optimization of Noisy Fitness Functions	112
11.3.3 Adaptation to Changing Environment.....	112
11.3.4 Discussion from the Application Side	113
11.3.5 Approach to Uncertain Optimization by GA	114
11.3.6 GA for Optimizing a Fitness Function with Noise	115
11.3.7 GA for Varying Environments	116
11.3.8 MFEGA and an Example of its Application	118
12 Control System Optimization by ES and PSO	121
12.1 Evolution Strategies	121
12.1.1 Framework of Evolution Strategies.....	121
12.1.2 Algorithm Designs for Evolutionary Algorithms	128
12.2 Optimization of Noisy Fitness with Evolution Strategies	128
12.2.1 Ways to Cope with Uncertainty	129
12.2.2 Optimal Computing Budget Allocation.....	131
12.2.3 Threshold Selection	132
12.3 Particle Swarm Optimization	137
12.3.1 Framework of Particle Swarm Optimization.....	137
12.3.2 PSO and Noisy Optimization Problems.....	139
12.4 Summary.....	141
13 Intelligent Control by Combinatorial Optimization.....	143
13.1 Branch-and-Bound Search	143
13.2 Tabu Search	145
13.2.1 Definition of the Problem.....	145
13.2.2 Local Search	145
13.2.3 Basic Structure of Tabu Search.....	147

Part IV Topics in Modern Control for Transportation Systems

14 The S-ring: a Transportation System Model for Benchmarking	151
14.1 The Kac Ring	151
14.2 Definition of the S-ring Model.....	153
14.3 Control of the S-ring	156
14.3.1 Representations of the Policy	156
14.3.2 Policy Examples	157
14.3.3 Extensions	157
14.4 A Prototype S-ring	158
14.5 Solution by Dynamic Programming	158
14.5.1 Formulation	158

14.5.2	Solution	159
14.6	Solution by Numerical Methods	159
14.6.1	Kiefer–Wolfowitz Stochastic Approximation	160
14.6.2	Q-learning and Evolutionary Strategies	160
14.6.3	Results of the Optimization Experiments	161
14.7	Conclusions	161
15	Elevator Group Control by NN and Stochastic	
	Approximation	163
15.1	The Elevator Group Control as an Optimal Control Problem . .	164
15.2	Elevator Group Control by Neural Networks	165
15.2.1	State Representation for Elevator Group Control	166
15.3	Neurocontroller for Group Control	169
15.3.1	Structure of the Neurocontroller for Elevator Group Control	171
15.3.2	Initial Training of the Neurocontroller	174
15.4	Adaptive Optimal Control by the Stochastic Approximation . .	177
15.4.1	Outline of the Basic Adaptation Process	177
15.4.2	Sensitivity of the Controller Network	179
15.4.3	Simulation Results for Adaptive Optimal Group Control	182
15.5	Conclusions	186
16	Optimal Control by Evolution Strategies and PSO	187
16.1	Sequential Parameter Optimization	188
16.1.1	SPO as a Learning Tool	188
16.1.2	Tuning	190
16.1.3	Stochastic Process Models as Extensions of Classical Regression Models	191
16.1.4	Space-filling Designs	195
16.2	The S-ring Model as a Test Generator	195
16.3	Experimental Results for the S-ring Model	198
16.3.1	Evolution Strategies	198
16.3.2	Particle Swarm Optimization on the S-ring Model	203
16.4	Classical Algorithms on the S-ring Model	208
16.5	Criteria for Choosing an Optimization Algorithm	209
17	On Adaptive Cooperation of AGVs and Elevators	211
17.1	Introduction	211
17.2	Material Handling System for High-rise Buildings	212
17.3	Contract Net Protocol	213
17.4	Intrabuilding Traffic Simulator	214
17.4.1	Outline of the Simulator	214
17.4.2	Performance Index of Control	214
17.5	Cooperation based on Estimated Processing Time	216

17.5.1	Control Using Minimal Processing Time for Bidding . . .	216
17.5.2	Estimation of Processing Time by a Neural Network . . .	216
17.5.3	Numerical Example	217
17.6	Optimization of Performance	218
17.6.1	Bidding Function to be Optimized	218
17.6.2	Application of Genetic Algorithm	218
17.6.3	Numerical Example	219
17.7	Conclusion	219
18	Optimal Control of Multicar Elevator Systems	
	by Genetic Algorithms	221
18.1	Introduction	221
18.2	Multicar Elevator Systems and Controller Optimization	222
18.2.1	Multicar Elevator Systems	222
18.2.2	Controllers for MCE	223
18.2.3	Discrete Event Simulation of MCE	223
18.2.4	Simulation-based Optimization	224
18.2.5	Problems in Optimization	225
18.2.6	Acceleration of Computation	225
18.2.7	Re-examination of Configuration of Simulation	226
18.3	A Genetic Algorithm for Noisy Fitness Function	226
18.4	Comparison of GAs for Noisy Fitness	227
18.4.1	Setup of Experiments	227
18.4.2	Results of Experiment	228
18.5	Examination of Control Strategy	230
18.5.1	Examination of Zone Boundary	230
18.5.2	Effect of Weight Extension	230
18.6	Conclusion	232
19	Analysis and Optimization for Automated Vehicle Routing	235
19.1	Introduction	235
19.2	Basic Assumptions and Basic Analysis	236
19.2.1	Parallel and Bottleneck-Free PCVRS	236
19.2.2	Interferences and Steady State	237
19.2.3	One Lap Behind Interference	239
19.2.4	Throughput and Mean Interference Time	240
19.3	Two Basic Vehicle Routings	241
19.3.1	Random Rule	242
19.3.2	Order Rule	242
19.4	Optimal Vehicle Rules	244
19.4.1	Exchange-Order Rule	244
19.4.2	Dynamic Order Rule	247
19.5	Numerical Simulation	247
19.6	Concluding Remarks	249

20	Tabu-based Optimization for Input/Output Scheduling	251
20.1	Introduction	251
20.2	Optimal Input/Output Scheduling Problem	251
20.3	Computational Complexity	252
20.4	Approximation Algorithm	253
20.5	Numerical Experiment	255
20.6	Concluding Remarks	255
	Program Listings	257
	References	261
	Index	275
